

Emissions level and emissions trend across the provisioning ranking

Each dot is one of 153 countries; the black rule is the cluster median (a) or mean (b).

Consumption-based greenhouse gases (AR6 GWP-100), 2000-2020. Panel a: the ranking adds nothing to a cubic in development level ($p = 0.51$). Panel b: it does ($p = 0.002$), and survives region fixed effects and control for the starting level, but 74% of the variance in rates lies within clusters rather than between them. Twenty countries lack footprint accounts.
